

StrucGAP\_GlycanStructure\_1: Overview of dominant glycan structures and substructure features.

a: Top 10 glycan structures identified based on the number of their modified N-glycosites.  
b: Number of glycan compositions grouped by their glycan isomer counts.  
c: Distribution of core structures among all unique IGPs, with Core-I (N2H3), Core-II (core-fucosylated), Core-III (bisected), and Core-IV (dual features) quantified.  
d: Classification of glycan types (complex, hybrid, and oligo-mannose) across all unique IGPs.  
e: Proportion of top 10 glycan branch structures.  
f: Absolute counts for the 8 low abundant branch structures.  
g: Branch count distribution among identified glycans, with frequencies shown per branch number category.  
h: The distribution and proportion of IGPs containing different numbers of sialic acid.  
i: The distribution and proportion of IGPs containing different numbers of fucose.  
j: The distribution and proportion of IGPs containing different sialylated types.  
k: Proportion of IGPs containing different fucosylation types.
