

a: Overall profiling of preprocessed glycoproteomics data.  
b: Number of glycoproteins grouped by the count of glycosylation sites.  
c: Top 10 glycoproteins ranked by the number of unique glycan structures observed across all glycosylation sites, reflecting glycan structural diversity.  
d: Top 10 glycosylation sites with the highest number of unique glycan structures, indicating site-specific glycan diversity across individual glycoproteins.  
e: Top 10 glycosylation sites ranked by the number of unique glycan compositions, reflecting the compositional diversity of glycans present at each site.  
f: Top 10 abundant glycan isomers identified within glycosylation site-specific glycan compositions. Each bar represents the dominant isomer (glycan structure) from a given glycosylation site and glycan composition pair.
