

StrucGAP_GlycanStructure_1: Overview of dominant glycan structures and substructure features.

a: Overall profiling of preprocessed glycoproteomics data.
b: Top 10 glycan structures identified based on the number of their modified N-glycosites.
c: Number of glycan compositions grouped by their glycan isomer counts.
d: Distribution of core structures among all unique IGPs, with Core-I (N2H3), Core-II (core-fucosylated), Core-III (bisected), and Core-IV (dual features) quantified.
e: Classification of glycan types (complex, hybrid, and oligo-mannose) across all unique IGPs.
f: Proportion of top 10 glycan branch structures.
g: Absolute counts for the 8 low abundant branch structures.
h: Branch count distribution among identified glycans, with frequencies shown per branch number category.
i: Co-occurrence analysis revealing preferential pairing between core structures and branch structures.
j: Co-occurrence analysis revealing preferential pairing between branch structures and branch structures.
k: Co-occurrence analysis revealing preferential pairing between branch structures and core structures.
